#### Table 1: Density Conditions

a) Methodology for determining estimated capital costs and cash-in-lieu contribution for section b.ii.:

The analysis identified a conservative capital cost commensurate with 75% of estimated land lift for mid-rise wood frame strata housing applications seeking the maximum density levels of the bylaw. Aligning the required level of capital costs to 75% of the land lift associated with the increase in density maintains motivation for applicants to pursue the bonus density. Analysis suggested that the 75% of the land lift equates to the capital costs of providing 0.5% of total floor area as below-market homeownership unit(s) based on the case studies included in the financial analysis. The estimated capital costs associated with the required below-market homeownership unit(s) were then translated into an equivalent cash-in-lieu contribution of \$107.64 per square metre above the base density.

<sup>\*</sup> For greater certainty, cash-in-lieu cannot be provided as an alternative to providing 15% of **Dwelling Units** as three **Bedrooms** .
